

CODE CHECK project

reviewing code in research publications

A process for independent reproduction of computations underlying research

The four CODE CHECK principles

1. Codecheckers are humans and communication is key.

- A human codechecker can understand docs
- *No* scientific judgement
- Effective two-way means of communication
- *Supported by* formal metadata, automation, and reproducibility infrastructure
- Diverse roles (ECRs, RSEs)

2. Codecheckers record but don't investigate or fix.

- *Not* fixing, but *document* state
- Interest + skills = collaboration & improvement
- Report informs the scientific review, but not evaluate scientific merit!
- Failed check != rejection

Codechecker take the pictures at a crime scene, they do not hunt the murderer.

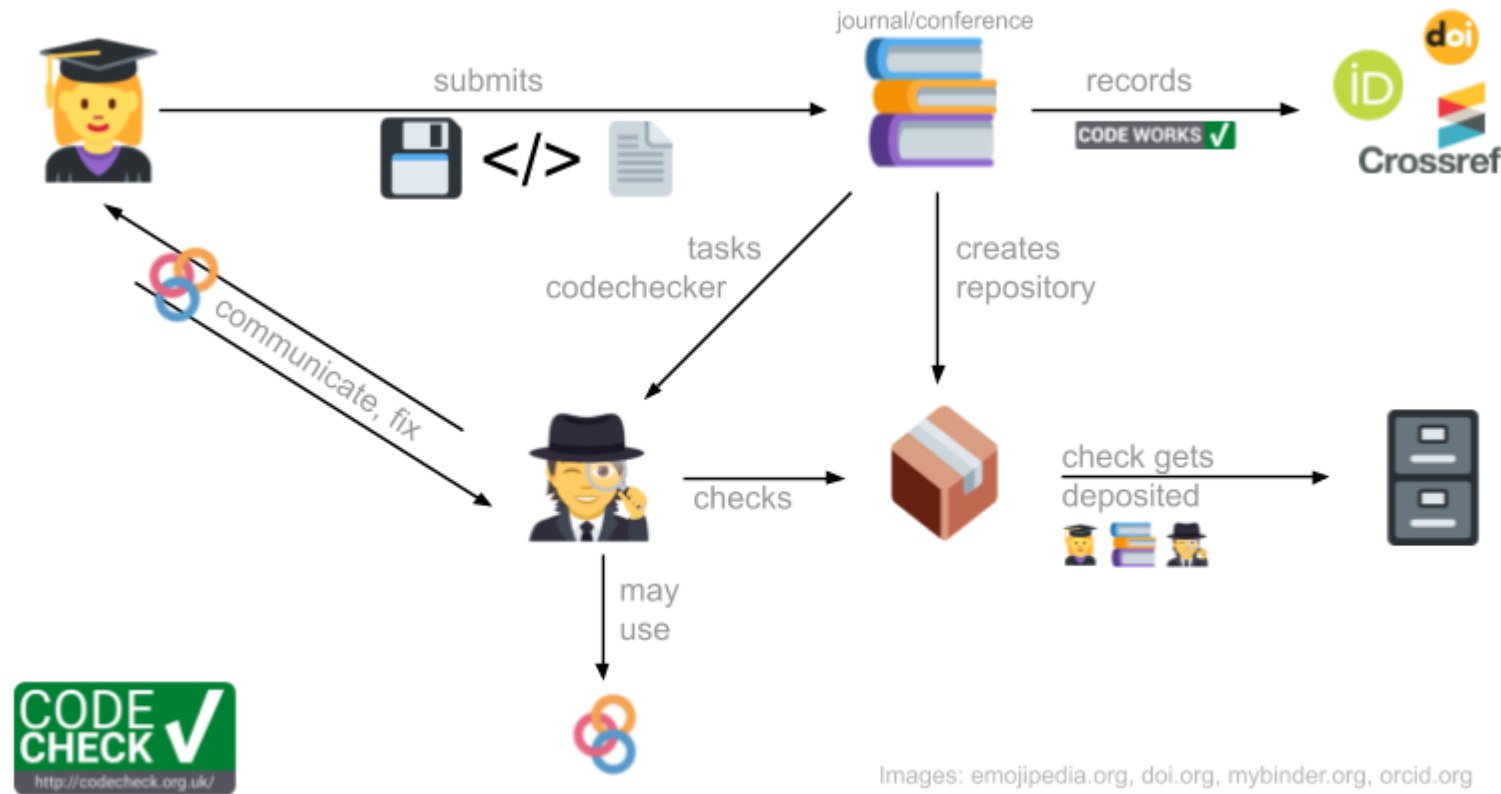

3. Credit is given to codecheckers.

- Software is crucial for research
- Check is contribution to the scientific body of knowledge
- If part of a review process
 - publisher ensures creditation equal to scientific reviewer
 - methods section *statement*
 - deposited metadata (not report):
 - codechecker's ORCID
 - time, journal
 - (article DOI)
- DOI-able report, URL in *statement*

4. Workflows are scripted, auditable, and they work.

- Common sense
 - documentation
 - degree of openness
 - amount of data
- Minimal requirement
 - Code executed once
 - Scripted workflow
- "Everything is there" *for the checked data & code*, and auditable
- Not all steps must be checked

Implementing the CODE CHECK process

Sketch of steps to implement a CODE CHECK.

CODE WORKS ✓

Process variations

- Post review with extra role
- Pre-review with extra role on staff
- Parallel reproducibility reviewer
- Regular reviewer
- Independent community pre-review
